SOC INVESTIGATOR · SPRINT 1 PROCESS GUIDE

Git Workflow & Project Tracking Guide

Branching, Commit, and PR Process for All Contributors

APPLIES TO
All Team Members

DOCUMENT CODE
SOC-DOC-00

PROJECT
Cyber Cortex — SOC Investigator

ISSUE DATE
27 August 2026

GitHub Branches

GitHub branches have also been separated according to everyone's role. Please work only on your assigned branch.

Branch assignments:

- Ragini → `backend-api`
- Java → `frontend-dashboard`
- Jyotshna → `frontend-investigation`
- Ankit → `security-engine`
- Anmol → `ai-integration`
- Anshu → project lead / integration

Switching to Your Branch

First, switch to your assigned branch:

```
git fetch origin
git switch <your-branch-name>
git pull origin <your-branch-name>
```

For example, Ragini:

```
git fetch origin
git switch backend-api
git pull origin backend-api
```

Ankit:

```
git fetch origin
git switch security-engine
git pull origin security-engine
```

After switching, verify your branch:

```
git branch --show-current
```

It should show your assigned branch name.

> **Important:** Please don't directly work on `main`. Make your changes on your assigned branch and push your work there.

Committing and Pushing Your Work

When you complete a task:

```
git add .
git commit -m "feat: describe your change"
git push origin <your-branch-name>
```

Then create a Pull Request → your branch → `main` for review.

📊 Project Tracking

I've also created a GitHub Project — **"Cyber Cortex — SOC Investigator Development"** — where everyone's tasks are assigned.

Please use it to keep your work status updated:

Backlog → Ready → In Progress → Review → Done

- When you start working, move your task to **In Progress**.
- When your implementation is ready, move it to **Review** and create your PR.
- After the PR is reviewed/merged, mark it **Done**.

This will help everyone see who is working on what, what is completed, and what is blocked/dependent on another member.

For Sprint 1, please don't randomly modify other members' modules. If your task requires changes in another person's area, coordinate with them first.

Let's keep the repository clean and work in parallel without conflicts. 🚀

One Important Thing

For team members who already cloned the repository, they only need:

```
git fetch origin
git switch backend-api       # replace with their branch
git pull origin backend-api
```

They do **not** need to clone the repository again.

And for people whose branch doesn't exist locally yet, `git switch` may need:

```
git fetch origin
git switch --track origin/backend-api
```

Replace `backend-api` with their assigned branch.

That gives you a clean workflow: **one person → one branch → one assigned area → PR → review → merge into `main`.** 🔥
